MAÇON

STUDIO MAÇON · HANDOVER · UPDATED SEPTEMBER 2026

GETTING READY TO RUN ADS

Everything that has to be true before we spend money on Meta ads: the site tracked properly, the emails arriving in inboxes rather than spam, and an order that goes all the way through — paid, confirmed, shipped, tracked.

Each item below says who does it. “Claude” means it needs no login and is already done or can be done any time. “Alex” or “Hannah” means it needs an account only you can get into.

The one rule: Stage 1 is safe to do today. Stages 2 and 3 happen on the day studiomacon.co moves off Wix — not before, because until then those links still point at the old site.

ALREADY DONE

AREA	STATE
Website, all pages, phone and desktop	Built and tested on the preview
Shopify: products, prices, sizes, payments, shipping, tax	Live, out of test mode
Checkout and Apple Pay buttons	Create a Shopify cart and hand off to Shopify checkout
Contact and commission forms	Tested end to end; SPF, DKIM, DMARC all pass
Meta pixel, GA4, Google Ads, Klaviyo on-site	In every page; they switch on by themselves on studiomacon.co
Product feeds for Meta and Google	meta-catalog.csv and google-products.xml, rebuilt with the site
Old Wix addresses	Redirect to the matching new page
Emails designed and built	3 welcome, 2 abandoned checkout, browse, 2 thank-you, repeat order, win-back, **and now shipping/tracking**
DNS	On Cloudflare; switch day is a two-record change

WHAT IS MISSING

- **Emails have never been sent from Shopify.** The templates are written, but Shopify's “send a test” has been unavailable, so none of the order emails have been seen in a real inbox.
- **No test order has been placed** with a real card, so the full chain — pay, confirm, fulfil, track — is unproven.
- Klaviyo's signing records at Cloudflare are set to “proxied”, which breaks its email signing and makes Klaviyo mail more likely to land in spam.
- Shopify's own emails are still sent as a Shopify address, not an authenticated studiomacon.co sender.
- The footer newsletter box needs one Shopify key before it can add people to the list.
- Product photographs are missing inside Shopify, so checkout and receipts show grey boxes.

EMAIL THAT ACTUALLY ARRIVES

ALEX 1 · Un-proxy the email signing records

Cloudflare → studiomacon.co → DNS → Records. These are orange (“proxied”), which breaks signing. Open each, set **Proxy status** → **DNS only**, save:

`kl._domainkey` `kl2._domainkey` `hello` `newsletter` `s1._domainkey` `s2._domainkey` `sel1._domainkey` `sg`

Why: Klaviyo's welcome and reminder emails are signed with those records. Unsigned mail from a domain that publishes DMARC is treated as suspicious.

ALEX 2 · Make Shopify send as studiomacon.co

Shopify admin → Settings → Notifications → Sender email → *Authenticate*. Shopify gives four CNAME records; add them in Cloudflare as **DNS only**. Send me a screenshot and I'll check they match.

Why: order confirmations and shipping emails are the ones customers actually wait for. Sent from an unauthenticated address, they are the most likely of all our mail to be filtered.

HANNAH 3 · Paste the four order emails into Shopify

Shopify admin → Settings → Notifications → Customer notifications. For each one below, open it, select all the code, and paste in the file Alex sends:

SHOPIFY NOTIFICATION	FILE	WHAT IT IS
Order confirmation	thanks-1.html	“Your piece is being made”
Shipping confirmation	shipping-1.html	“On its way to you”, with the tracking button
Shipping update	shipping-1.html	Same template; used if tracking changes
Abandoned checkout	checkout-1.html	Only if we send it from Shopify instead of Klaviyo

After each paste, press **Preview**, then **Send test email** to hello@ and to a personal Gmail. If Shopify still says tests are unavailable, tell me and we prove it with the real test order in Stage 3 instead.

ALEX 4 · Klaviyo key for the footer sign-up

The site's footer box is wired but needs one value: Klaviyo → Settings → API keys → a private key with `list write`. Send it to me and the sign-up starts working the same day.

ADS PLUMBING

HANNAH 5 · Shopify's “Facebook & Instagram” app

`apps.shopify.com/facebook` → Install → log in with the account that runs our ads.

- Pixel: choose the existing one ending **…574699**. Never a new one.
- Data sharing: **Maximum**.
- If it offers to make a catalog: yes.

Why: the purchase happens on Shopify's checkout, so this app is what tells Meta a sale happened.

HANNAH 6 · Shopify's “Google & YouTube” app

`apps.shopify.com/google` → Install → connect Analytics **G-B5GNGQ1WME** and Google Ads **AW-16466703173**, conversion tracking on. Connect Merchant Center but skip adding products for now.

HANNAH 7 · Leave the Wix catalog alone

If Meta warns about removing a catalog, click **Keep**. The old catalog keeps the ads running until switch day.

> **Meta ads cannot be judged before this is done.** Until the pixel hears purchases from Shopify, the ad account has no idea which ads pay for themselves, and Meta's own optimisation is guessing. Stage 1 is the difference between spending money and learning something.

THE DAY ITSELF

CLAUDE ALEX **8 · Point the domain at the new site**

Alex says go. I delete the two Wix records and attach the new site, about five minutes, then check the home page, a product, the bag, a Wix redirect, video on iPhone, and that mail to hello@ still arrives.

HANNAH **9 · Give Shopify the product photographs**

Products → Import → the file `shopify/product-images.csv` → tick **Overwrite products with matching handles**. Only works after step 8, since Shopify fetches each photograph from studiomacon.co.

HANNAH **10 · Point Meta's catalog at the new site**

`business.facebook.com/commerce` → our catalog → Catalog → Data sources → Supplementary feeds → Add → Scheduled feed:

`https://studiomacon.co/meta-catalog.csv` — repeat Daily, currency USD.

Then move each product ad onto that catalog. Google Merchant Center gets the same treatment with `https://studiomacon.co/google-products.xml`.

CLAUDE **11 · Emails repointed and resubmitted**

I rebuild the emails against the live domain, re-submit the sitemap in Search Console, and re-check the feeds. Nothing for you to do.

PROVING IT WORKS

ALEX HANNAH 12 · One real order, all the way through

This is the important one, and it is the only way to see every email at once.

- Buy a real piece with a real card, from a phone, using a personal email address.
- Expect: Shopify's **order confirmation** within a minute, and our “Your piece is being made” if it is set as the confirmation template.
- In Shopify, mark it fulfilled and paste any tracking number. Expect the **shipping email** with a working Follow your parcel button.
- Then refund it. Expect the **refund notification**.
- Check each email in Gmail: not in spam, photographs visible, ç in Maçon correct, buttons working on a phone.

HANNAH 13 · Meta is hearing the site

Events Manager → pixel …574699 → Test events → open studiomacon.co. Look at a piece, add to bag, start checkout. You should see **PageView, ViewContent, AddToCart, InitiateCheckout**. Purchase appears from the real order in step 12.

HANNAH 14 · Google is hearing the site

Analytics → Reports → Realtime; open the site on your phone and you should appear within a minute. Also check Commerce Manager → Items shows about 69 items with no red issues.

ALEX 15 · Spam check

Send one of our emails to the address that `mail-tester.com` gives you; aim for 9/10 or better. It reads SPF, DKIM, DMARC and the content, and names anything that needs fixing.

TIDYING AND THE AD PLAN

HANNAH **16 · Retire the Wix side**

Only once Stage 3 is clean: delete the old Wix catalog in Commerce Manager (check no ad uses it), disconnect Facebook and Google in Wix, then cancel the Wix plan. Keep the domain — it lives at GoDaddy.

ALEX **17 · Decide where the welcome email lives**

Right now Klaviyo sends the welcome series with MACON10, and Shopify sends the order emails. That works. The alternative is moving everything into Shopify Messaging and turning the Klaviyo flows off, which means one list and one bill. Either is fine; the mistake would be leaving both switched on, since new subscribers would get two welcomes.

CLAUDE **18 · Watch the first week**

Once orders start, I can read the feeds and Search Console, check what the pixel is receiving and whether any product is failing in the catalogs, and fix the site side of anything that looks wrong.

APPLE PAY — MY RECOMMENDATION

Today our Apple Pay button builds the cart and hands off to Shopify's checkout, where Apple Pay is offered. It is one page-load slower than the instant sheet. The instant sheet only exists if the payment sheet runs on our own domain, which means either embedding Shopify's own accelerated-checkout button, or registering the domain with Apple and driving Shopify's Storefront API ourselves.

Recommendation: leave it as it is for launch. Embedding Shopify's button brings Shopify's styling into our layout, and the Storefront route is a week of work plus an Apple merchant verification that cannot even be started until the domain is live. Neither changes whether a sale completes. Revisit once ads are running and we can see how many people drop at checkout.

NUMBERS AND ADDRESSES

THING	VALUE
Meta pixel	501136812574699
Meta domain verification	ae0yp3uhbruy2um27iahgcmha7bnph
Google Analytics	G-B5GNGQ1WME
Google Ads	AW-16466703173
Shopify store	w3nidi-ny.myshopify.com
Meta feed	https://studiomacon.co/meta-catalog.csv
Google feed	https://studiomacon.co/google-products.xml
Sitemap	https://studiomacon.co/sitemap.xml
Preview site (stays up after launch)	studiomacon.studiomacon.workers.dev
Welcome discount	MACON10 — 10% off a first order
Email templates	site folder → pdp/email/shopify/
Product photo import	site folder → pdp/shopify/product-images.csv

ORDER OF PLAY, IN ONE LINE

Un-proxy the DNS records and authenticate the sender → paste the order emails → install the two Shopify apps → switch the domain → import the photographs → repoint the catalogs → place one real order and follow it all the way to a refund → check the pixel, Analytics and a spam score → only then turn the ads up.

If something looks wrong at any point, a screenshot is enough. Most of these settings are reversible, and the domain can be pointed back at Wix in minutes if it ever needs to be.
